Write Code Every Day

Last fall, work on my [coding side projects](#) came to a head: I wasn't making adequate progress and I couldn't find a way to get more done without sacrificing my ability to do effective work at [Khan Academy](#).

There were a few major problems with how I was working on my side projects. I was primarily working on them during the weekends and sometimes in the evenings during the week. This is a strategy that does not work well for me, as it turns out. I was burdened with an incredible amount of stress to try and complete as much high quality work as possible during the weekend (and if I was unable to it felt like a failure). This was a problem as there's no guarantee that every weekend will be free – nor that I'll want to program all day for two days (removing any chance of relaxation or doing anything fun).

There's also the issue that a week between working on some code is a long time, it's very easy to forget what you were working on or what you left off on (even if you keep notes). Not to mention if you miss a weekend you end up with a two week gap as a result. That massive multi-week context switch can be deadly (I've had many
